

# RunForRecht

A step-counter and team-challenge app that turns the justice authority's annual step competition into a fair and effortless digital experience.

First place of six teams, jury award

Concept to working app

# A popular competition, run entirely by hand

Every year, courts and offices across Brandenburg's justice system compete for four weeks to see which Dienststelle walks the most steps. The event is loved. The process behind it wasn't.

## Paper & Excel

Steps were tallied by hand and typed into spreadsheets, which was slow and error-prone.

## Weekly e-mail

Standings arrived once a week by mail. By then the motivation had already cooled off.

## Names on lists

Published name lists raised privacy concerns in an authority where privacy is the job.

# Interviews with organisers and participants set the direction

## 01 Privacy is non-negotiable

Individual names must never appear in public rankings.  
Offices compete, not people.

## 02 Entering steps must be effortless

Any friction in data entry kills participation, so tracking should happen by itself.

## 03 Feedback needs to be immediate

A weekly e-mail is too slow to sustain a competition. Standings should be live.

## 04 Small offices are the most engaged

Participation was highest in small Dienststellen, so the ranking has to feel fair across office sizes.

## THE CONCEPT

# Count automatically, compete as offices, protect every name

- **Automatic step tracking** via the phone's sensors, with manual back-entry for the days in between.
- **A live ranking of Dienststellen:** offices compete publicly, individuals compare privately within their own office.
- **Two roles by design:** participants track and compare, managers oversee their office without seeing more than they need.

The interface is in German, designed for a German authority.

# One glance a day is enough

Steps count themselves. The app's job is to make progress and standing visible in seconds.

Daily goal at a glance

Live office ranking without names

Personal statistics, kept private

## THE MANAGER VIEW

# Nobody gets left out of the competition

Not every employee has a work smartphone. Office managers get their own role: they see their Dienststelle's totals, keep an eye on participation, and can enter steps on behalf of colleagues.

Names stay inside the office. Outside of it, only the office itself appears in the ranking. Privacy by design, not by policy.

FROM DESIGN TO WORKING APP

# The concept didn't stay in Figma. We shipped a working app

**Design system** Component library, icon set and brand in Figma, built to be implemented rather than just presented.

---

**Full stack** Ionic Angular frontend on a Spring backend with a real database and role-based access.

---

**Tested & iterated** Two evaluation rounds with users. Findings went straight back into design and code.

---

**My part** User research and UX/UI design across the project, and frontend development in the build phase.

ONE SEMESTER, TEAM OF FOUR

14

weeks from kick-off to live demo

Figma

Ionic Angular

Spring

# 1st

of six teams, awarded by the semester jury

## Research depth plus a working product won the semester

Of my study projects, this is the one that came closest to real product work: a real client, real user research, real constraints, and an app you could hold in your hand at the final demo.
